Name $\qquad$

## Sopeed 1 Torials

Problem: To calculate speed
Background Information: Motion is a change in position measured by distance and time.

Speed is the rate of change in position. Speed combines
information about how far an object moves (distance) with how long it takes to move that distance (time).

Speed is the rate at which an object moves.

$$
\text { Speed }=\text { distance } \div \text { time }
$$

Distance and Time can also be calculated with this formula.
Distance $=$ speed $X$ time
Time $=$ distance $\div$ speed

## Materials:

| Stopwatch | 1 m board | Wood blocks |
| :--- | :--- | :--- |
| Toy car | Calculator |  |

## Procedure:

1. Use the wood blocks and the board to build a ramp
2. Put the toy car at the top of the ramp, with the front wheels behind the edge of the board.
3. On the signal, release the toy car so that it rolls down the ramp AND start the stopwatch.
4. Stop timing when the back wheels of the toy car leave the end of the ramp.
5. Record the data.
6. Repeat the procedure for a total of 5 times.
7. Average the data.

## Data:

| Trial 1 | Trial 2 | Trial 3 | Trial 4 | Trial 5 | Average |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |  |

## Questions:

1. Use your textbook to describe:
a. Average speed
$\qquad$
$\qquad$
b. Instantaneous speed
$\qquad$
$\qquad$
c. Constant speed
$\qquad$
$\qquad$
2. How is instantaneous speed different from average speed?
$\qquad$
$\qquad$
$\qquad$
3. If you drive 200 miles in 3 hours before stopping for 30 minutes for lunch and gas. After lunch you travel 150 miles in an hour and a half. What was your average speed for the trip? Show your work.
